

Actividad de Docker

BIBIANA THONAMZIN BARCENAS MARTINEZ

17 de enero de 2022

Ejecutar una imagen existente en Docker. En la terminal correr el comando:

\$ docker run docker/whalesay cowsay boo

Notas: - El símbolo del dólar no se incluye, denota que es un comando que se ejecuta en una línea de terminal. - El string "boo" lo pueden cambiar por cualquier texto que quieran 😊

The image displays two screenshots of the Docker Desktop application interface, showing the management of a container named `c8bfl3lm_c8bfl5dmrepg00ddtqu0`.

Top Screenshot: The interface shows the container's IP address as `192.168.0.13`. The memory usage is `8.51% (340.3MiB / 3.906GiB)` and the CPU usage is `0.15%`. The terminal output shows the command `$ docker run hello-world` being executed, which pulls the `hello-world:latest` image from Docker Hub and displays the message "Hello from Docker!".

Bottom Screenshot: The interface shows the container's IP address as `192.168.0.13`. The memory usage is `8.50% (340.2MiB / 3.906GiB)` and the CPU usage is `0.18%`. The terminal output shows the command `$ docker run -it ubuntu bash` being executed, which starts an interactive Ubuntu shell. The output also includes instructions on how to generate the message and links to Docker Hub and documentation.
